VS-08-461379A

Patent No. 5871961

GENERAL INFORMATION:

APPLICANT: Smith, Kendall A. & Beadling, Carol

APPLICANT: Smith, Kendall A. & Beadling, Carol

TITLE OF INVENTION: Nucleic Acids Encoding CR5 Polypeptide,

TITLE OF INVENTION: Vector and Transformed Cell Thereof, and

TITLE OF INVENTION: Expression Thereof

NUMBER OF SEQUENCES: 35

CORRESPONDENCE ADDRESS:

ADDRESSEE: (B) STREET:One Westlakes-Berwyn

CITY: Valley Forge

STATE: Pennsylvania

COUNTRY: USA

IP: 19482

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Version #1.25

Patent No. 5882894
GENERAL INFORMATION:
APPLICANT: Smith, K. A., & Beadling, C.
TITLE OF INVENTION: Nucleic Acids Encoding CR8 Polypeptide, Vector and TITLE OF INVENTION: Transformed Cell Thereof, and Expression Thereof NUMBER OF SEQUENCES: 35
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ratner & Prestia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TYPE: peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                          Sequence 26, Application US/08652446
Patent No. 6657427
GENERAL INFORMATION:
APPLICANT: Smith, Kendall A. & Beadling, Carol
APPLICANT: Mucleic Acids Encoding CR5
TITLE OF INVENTION: Nucleic Acids encoding CR5
TITLE OF INVENTION: Polypeptide, Vector and Transformed Cell Thereof,
TITLE OF INVENTION: Expression Thereof

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Kapeller, Rosana
TITLE OF INVENTION: MOVEL MOLECULES OF THE
TITLE OF INVENTION: AND USES THEREOF
FILE REFERENCE: 035800/175631
CURRENT APPLICATION NUMBER: US/09/644,450
CURRENT FILING DATE: 2000-08-23
NUMBER OF SEQ ID NOS: 11
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 7
LENGTH: 313
TYPE: PRT
ORGANISM: Mus musculus

TITLE OF INVENTION: Modulators of Cellular Proliferation
FILE REFERENCE: 021044-004010US
CURRENT APPLICATION NUMBER: US/10/620,052A
CURRENT FILING DATE: 2003-07-14
PRIOR APPLICATION NUMBER: US 60/395,443
PRIOR FILING DATE: 2002-07-12
NUMBER OF SEQ ID NOS: 78
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 22
LENGTH: 313
TYPE: PRT
ORCANISM: Homo sapiens
FEATURE:
COTHER INFORMATION: PIM1 oncogene serine threonine kinase

#### RESULT 1 Homo Pim1; tyrosine threonine kinase; TTK; protein kinase; enzyme; mitotic checkpoint; colon cancer; breast cancer; tumour; cytostatic; human; gene therapy. Reinhard C, Jefferson Human Pim1 21-FEB-2001; 2001US-0271254P 06-SEP-2002 ABP54943; 21-FEB-2002; 2002WO-US005278 WO200268444-A1 13-JAN-2003 ABP54943 standard; protein; 313 (CHIR ) CHIRON CORP 2002-698650/75 sapiens. (first entry) Æ, Chan Æ ≨

Reducing growth of cancer cells comprises reducing Tyrosine Threonine Kinase (TTK) activity, useful in diagnosing and treating disorders with abnormal expression levels and activity of TTK, such as lung, colon, prostate and ovarian cancer.

N-PSDB; WPI;

Disclosure; Page 80-81; 113pp; English.

The present sequence is the protein sequence of human Piml, a protein related to tyrosine threonine kinase (TTK, see ABP54938). TTK polymucleotides and polypeptides of the invention encompass polymucleotides and polypeptides having sequence similarity or sequence identity to human TTK and other genes and gene products related to TTK, such as Piml. The invention is based on the finding that TTK is differentially expressed in various forms of cancer. It provides methods for the identification of cancerous cells, especially breast cancer and colon cancer cells, by detection of expression levels of TTK, as well as

These methods can be used as the basis of rational therapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK are also
            Modulating levels or activity of HKID-1 polypeptides, a member of serine/threonine kinase superfamily, for treating cancer, by contacting cell expressing the polypeptide with a modulator of the polypeptide.

The method involves contacting a cell expressing the polypeptide or nucleic acid with an agent to modulate the level or activity of polypeptide, or level of nucleic acid molecule. The method i useful for modulating the level or activity of HKID-1 polypeptide or polynucleotide in a subject having or predisposed to having a disorder involving cancer. Modulating HKID-1 expression or activity is useful for therapeutic purposes, for treating cellular proliferative and/or differentiative disorders including cancer or haematopoietic neoplastic disorders e.g. Acute promyeloid leukaemia (APML), Chronic myelogenous leukaemia (CML) and Waldenstrom's macroglobulinaemia (WM). This is the amino acid sequence of a human protein kinase phosphorylation site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 313 AA;

PIM1 and PIM3 proteins and coding sequences are useful for treating chronic pain, particularly of neuropathic or inflammatory origin (e.g. where associated with diabetes, cancer, AIDS neurodegenerative diseases). The present sequence is human PIM1 kinase

normal cell, v is indicative ing cancer in a subject, by comparing expression levels of tyrosine ine kinase polypeptide or polynucleotide in a subject cell and a cell, where an increase in the expression level in the test cell

Disclosure; Page 34-35; 79pp; English.

CC a subject, comprising comparing the expression levels of tyrosine threonine kinase (TTK, a mitotic checkpoint gene) polypeptide or polynucleotide in a test cell obtained from the subject and in a normal connection acid in the test cell compared to that in the normal connectic acid in the test cell compared to that in the normal cell, con rucleic acid in the test cell compared to that in the normal cell condicates the presence of cancer other than ovarian cancer. Also included care reducing growth of a cancerous cell (by contacting a cancerous cell comprising; (i) detecting the activity of a cancerous cell (comprising; (i) detecting the candidate agent cancerous cell contacting a cancerous cell displaying elevated expression of a TTK contacting a cancerous cell displaying elevated expression of a TTK cancerous cell displaying elevated expression of a TTK contacting a cancerous cell displaying elevated expression of a TTK cancerous disease other than ovarian cancer in a contacting a cancerous cell displaying elevated expression of a TTK cancerous cell with a cancerous disease other than ovarian cancer in a contact of expression of TTK encoding polynucleotide in the test cancer cell with prognosis of the polynucleotide in the test cancer cell with prognosis of the polynucleotide in a control non-cancer cell with prognosis of the polynucleotide in the test cancer cell creduces growth of a cancerous cells, identifying a candidate agent that reduces TTK condicative of the prognosis of the polynucleotide in a control non-cancer cell is creduced growth of a cancerous cells, identifying a candidate agent that cancer cell creduces growth of a cancerous cells, identifying a candidate agent that cancer that reduces TTK activity and assessing the prognosis of a cancerous disease other than ovarian cancer) in a subject, or a subject to respond to a particul The invention relates to detecting cancer (other than ovarian can a subject, comprising comparing the expression levels of tyrosine cancer) in

PIM-1 proteins are the paralogues of novel human and murine PIM-3 proteins (see ABR6293; and ABR6293) of the invention, which are therefore expected to be involved in cancer and cell growth regulation. PIM-3 is also involved in the development of insulin resistance and type 2 diabetes mellitus. The invention relates to the use of PIM-3 nucleic acids and proteins in: screening assays for compounds that modulate insulin resistance or type 2 diabetes mellitus (e.g. chromosognal mapping, tissue typing, corrensic biology); predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, pharmacogenomics); and for the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing and for the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. the preparing a medicament for the preparing a med

                                     Identifying ligand binding to inact kinase (T) comprises contacting the contains reactive group at binding kinase-ligand conjugate formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table the specification) which is differentially expressed during pain. No The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                       Human PRO polypeptide #308

The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating of the polyneuropathy. This sequence represents a human PRO polypeptide of the
